Bolt-Down Bollards - Galvanised

Xpanda Security manufactures bolt down bollards, in any size or length, that you may require.

Bolt down bollards are used more as a visual deterrent barrier, usually to prevent vehicles from entering walkway areas where the public have unrestricted access.

The bolt down bollard is also an alternate solution when fixed or removable bollards cannot be installed. The effectiveness of the bolt down bollard must not be underestimated. They can be filled with concrete for added protection against a ram raid, but obviously will not offer the same degree of protection as fixed bollards.

The fixing bolts are normally high tensile strength wedge anchor bolts, and can be welded in place once tightened, to prevent unauthorised removal. The size and type of bolt determines the amount of security it can provide. Bolt down bollards can be supplied with square, round or oblong mounting plates or collars. Galvanising and powder coating options are available and to a colour of your choice.

When should we choose Bolt-Down Bollards?

Bolt down bollards are perfect for protecting machinery or assets like electrical cabinets etc.

Bolt Down bollards for security should only be used in places where you are unable to dig for various reasons. Often Bolt-down bollards are used inside a shop because the business were unable to get permission to put fixed ones outside.

Bolt-down Bollards can be powder coated, prior to installation, to suit specific requirements of branding or just to suit the building better.

- Visual and effective deterrent
- Corrosion resistant finish
- Powder coating optional to a colour of your choice
- Alternate option to fixed bollards
- Less installation impact on environment
- Quick installation Removable and reusable
