Steel Cable-bars for shop counters and Reception desks

Xpanda Security manufactures an anti-jump system that uses a cable to prevent unauthorised access over a counter from a public area to a secured area.

Jump wires do not obstruct the visual connection with your customers, and you have no loss of speech clarity like you do with any acrylic system on the market.

Whether your counter is a simple straight line, on a corner, or in a U-shape Xpanda can make a system to suit. Multi-height counters are not a problem either.

Its important to understand that like any security product they are not absolute- if an attacker comes with the right equipment or enough force - but they are designed to greatly slow down entry so that you can call police and make yourself safe.

The system uses a single 5mm stranded steel PVC coated cable, threaded through a series of stainless steel pulleys and fixed to steel plates on opposite ends of the protected area.

Each end is then attached to mechanical tensioners, also secured to the same steel plates. The plates are housed behind secured covers to prevent tampering with the system. Bracing posts are fitted to prevent slack in the cable over longer distances. Posts and covers can be powder coated to a colour of choice.
